## Construction Master Keying:

The construction master key (CMK) is to be used temporarily while the building is under construction. When construction is completed, the end user defeats the CMK's operation by turning the change key in each cylinder, rather than replace or re-keying the cylinder.

Marks USA uses a program which is called the "lost ball" program. When construction key system is set up, three small ball bearings (construction balls) are placed between the bottom pin and master pin, normally in the last chamber as a "temporary master pin". The construction key is usually the same cut as the top master key with the exception of the sixth cut which is two increments higher. The construction master key will work in any cylinder until cylinder is "defeated" by making one full rotation in the cylinder with the change key. The cylinder plug requires a small diameter "pocket" drilled on one side of one pin chamber so when rotating the cylinder with the change key the pocket will capture the construction balls. The construction pocket in the plug is smaller than a pin chamber. This prevents any top pins or master pins from entering as the plug rotates. Once the cylinder is defeated, there is no way for the cylinder to be construction keyed again without disassembling it.
